WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). Bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties, all other cases are classified as "disease."

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant".

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

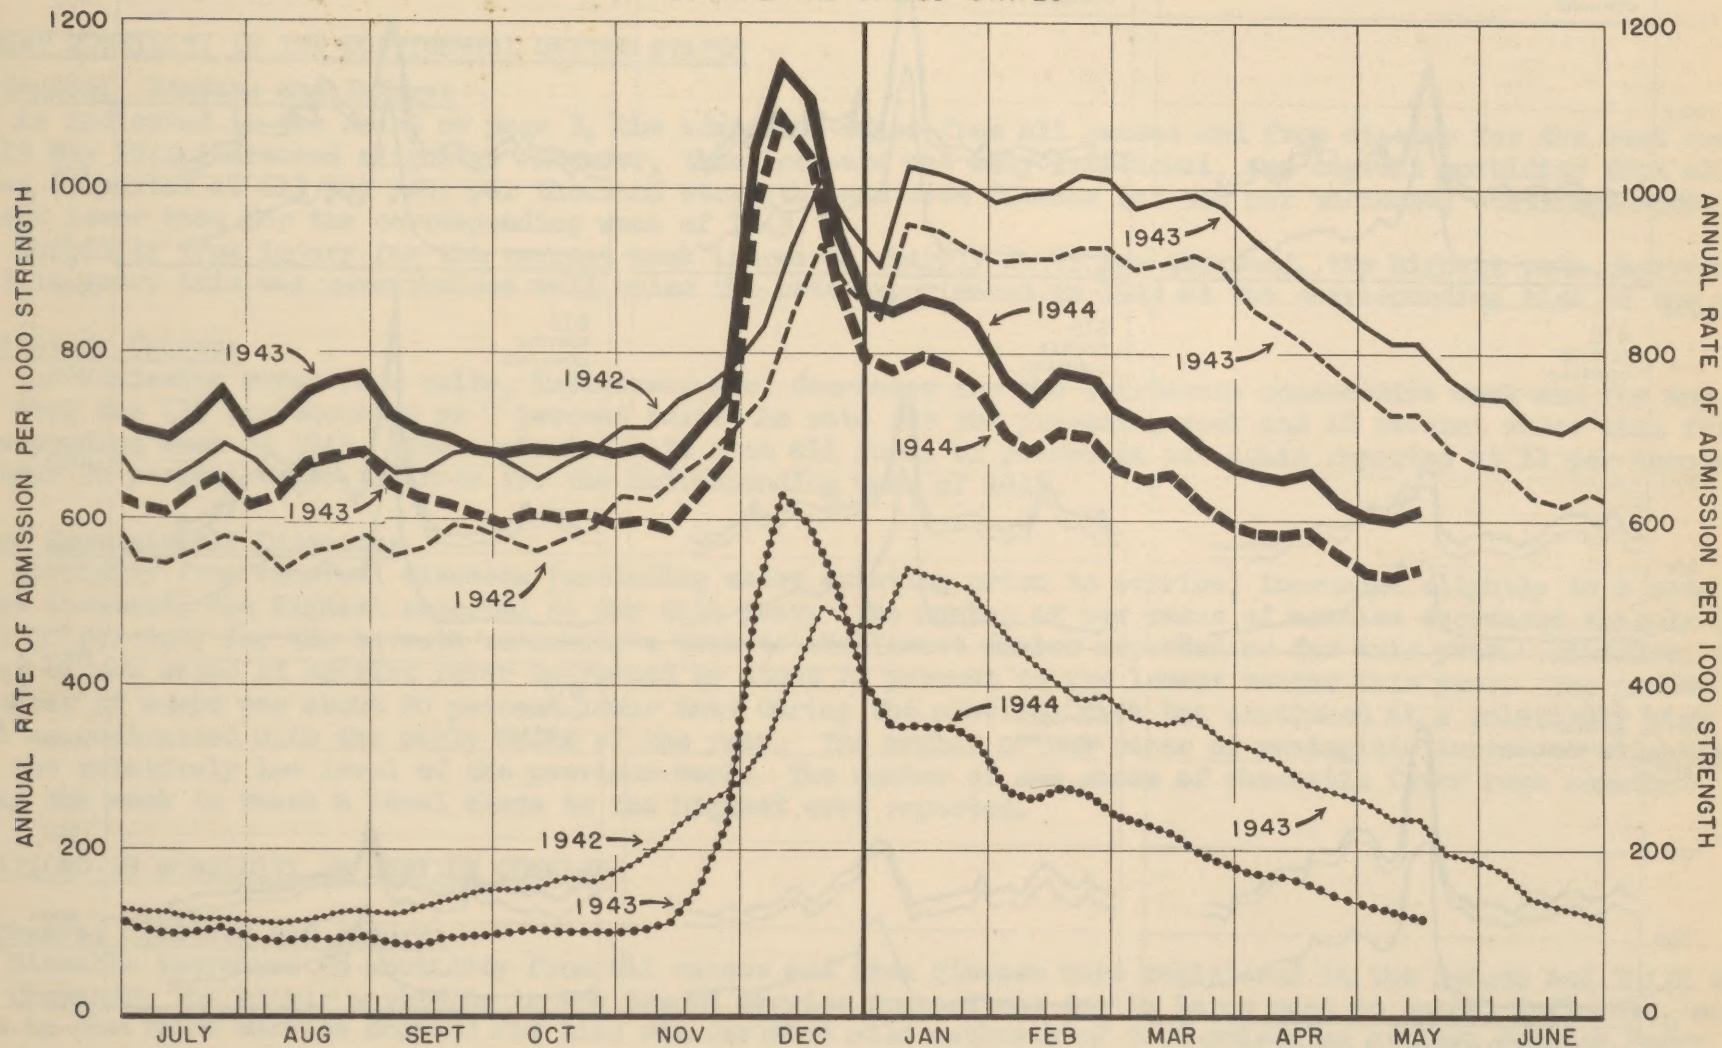

Because troops in transit and certain small detachments are not required to submit Reports, as well as for other reasons, the total strength of the reporting units as shown on this report has been consistently about four percent under the actual strength of the Army in the Continental United States.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 19 MAY 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes and from disease for the week ending 19 May 1944 increased slightly. However, this increase was only fractional, and current morbidity from all causes (reported at 613 per year per thousand strength) and from disease (at 540 per thousand) continued about 20 percent lower than for the corresponding week of 1943.

Morbidity from injury for the current week increased sharply to 73 per thousand, the highest rate reported so far this year; this was nevertheless well below the rate experienced in 1943 at the corresponding time of the year.

Respiratory Causes:

The admission rates from colds, influenza, etc. decreased for the thirteenth consecutive week and for the current week was 118 per thousand or 7 percent below the rate for the preceding week and 40 percent under that for the corresponding week of 1943. The admission rate from all forms of pneumonia was again reported at 11 per thousand or about 30 percent below the rate for the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal diseases (excluding cases existing prior to service) increased slightly to a rate of 33 per thousand, the highest reported so far this year. The number of new cases of measles decreased sharply (by about 30 percent) for the seventh consecutive week to the lowest number reported so far this year. Likewise, the number of new cases of scarlet fever decreased by about 20 percent to the lowest number this year. The number of new cases of mumps was about 20 percent lower than during the previous week but continued at a relatively high level as contrasted with the early weeks of the year. The number of new cases of meningitis increased slightly from the relatively low level of the previous week. The number of new cases of rheumatic fever rose somewhat during the week to reach a level close to the highest ever reported.

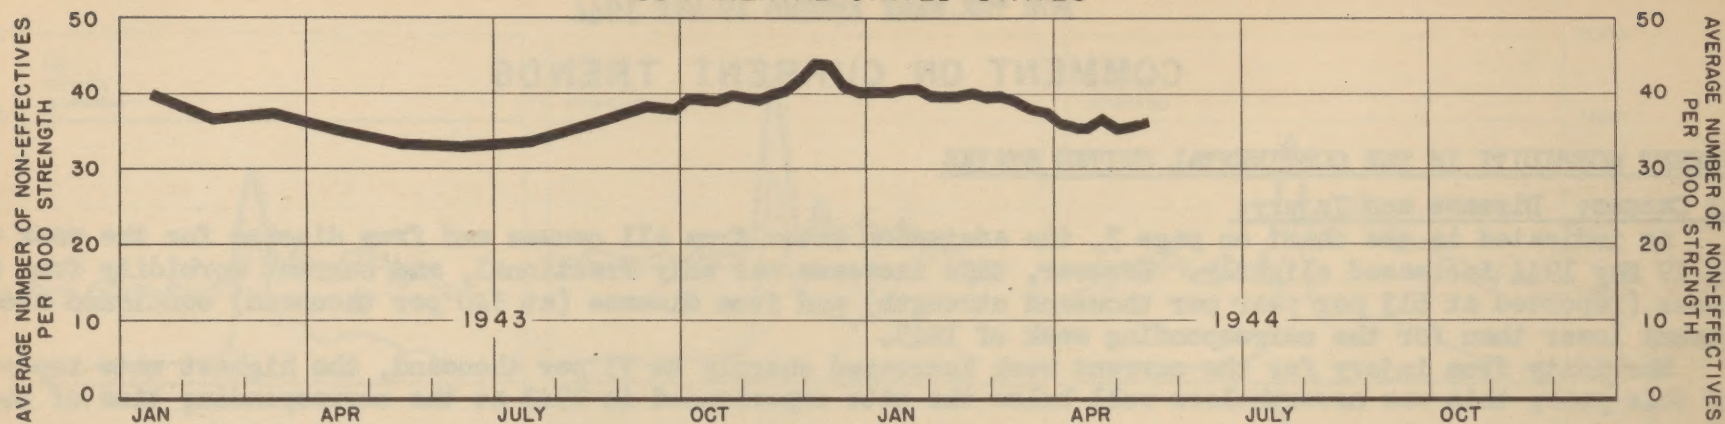

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All causes: Disease and Injury:

Sizeable increases in morbidity from all causes and from disease were registered in the Second and Third Service Commands; the higher morbidity in the Second Service Command was due in large part to colds, influenza, etc. while in the Third Service Command the rise was due to a mild outbreak of food poisoning at Camp Patrick Henry (437 cases). Only the Sixth and Ninth Service Commands showed appreciably lower morbidity from all causes. The Fourth, Fifth, Eighth, and Ninth Service Commands all showed significant increases in the admission rate from injury.

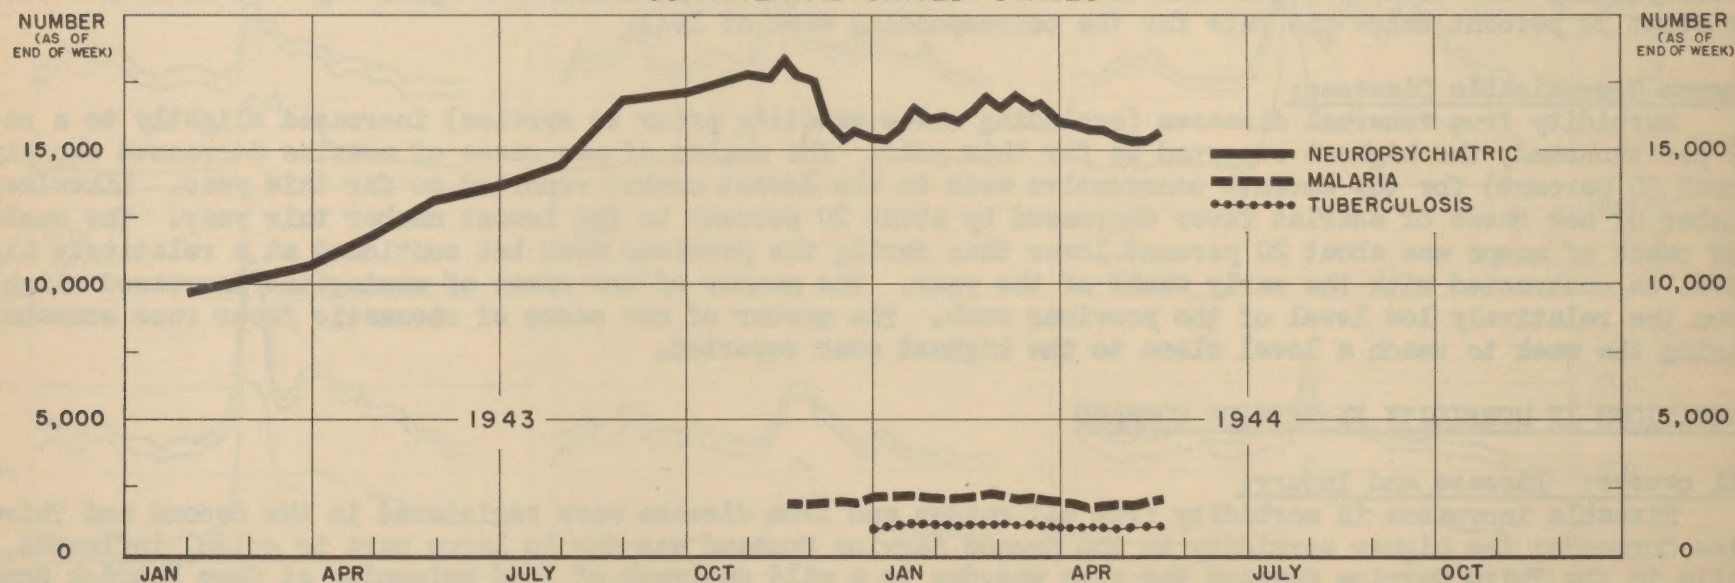

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

RESTRICTED

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 19 MAY 1944

COMMENT ON CURRENT TRENDS (CONT'D)

The highest morbidity from all causes (720 per thousand) and from disease (680 per thousand) was again reported by the Military District of Washington. The First Service Command continued to have the lowest morbidity from all causes (524 per thousand) and from disease (464 per thousand), the lowest rates experienced by any Service Command so far this year.

Respiratory Causes:

All Service Commands except the Second and Eighth and the Military District of Washington reported lower morbidity from colds, influenza, etc. and even in the last two the admission rate showed only a fractional increase. Despite a 15 percent decrease in the admission rate, the Seventh Service Command continued to report the highest morbidity from these causes (174 per thousand), while the lowest rate was again reported by the Fourth Service Command (91 per thousand) closely followed by the Third Service Command (96 per thousand).

Morbidity from pneumonia increased sharply in the Sixth Service Command and the Military District of Washington both of which reported rates of about 20 per thousand. Morbidity from this cause in the Fourth, Eighth, and Ninth Service Commands decreased to rates of less than 10 per thousand.

Common Communicable Diseases:

Markedly higher morbidity from venereal diseases (excluding EPTS) was reported in the First, Fifth, and Sixth Service Commands, while in the Second Service Command there was a sharp drop from the very high rate of the previous week. As a result, the Fifth and Sixth Service Commands (with rates of about 45 per thousand) reported the highest morbidity from this cause.

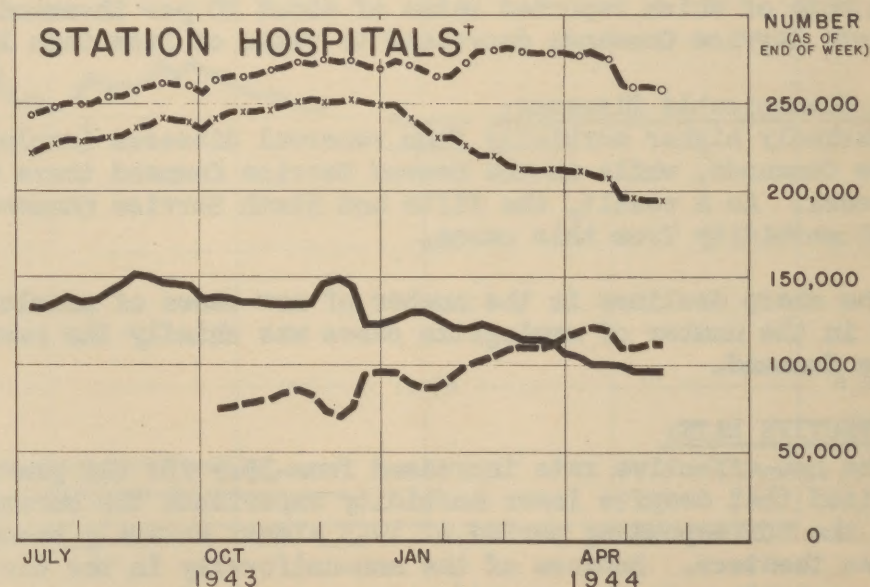

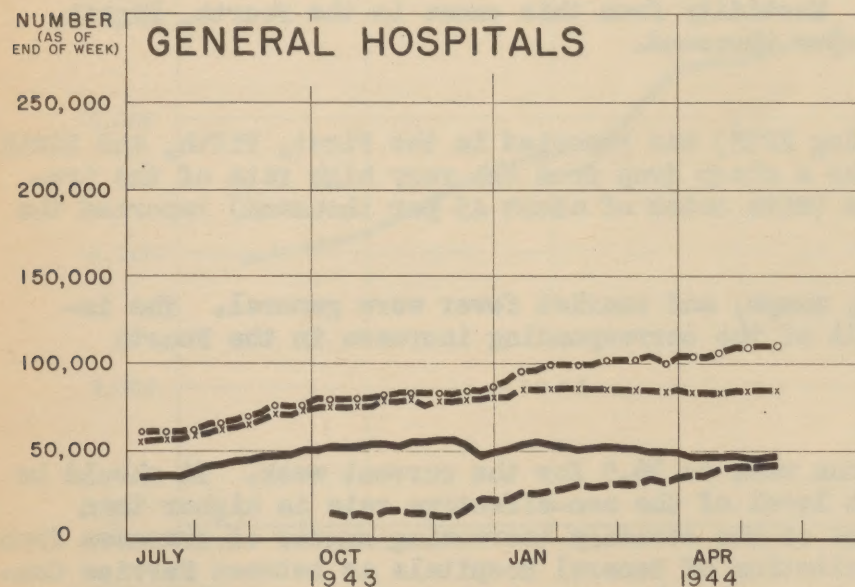

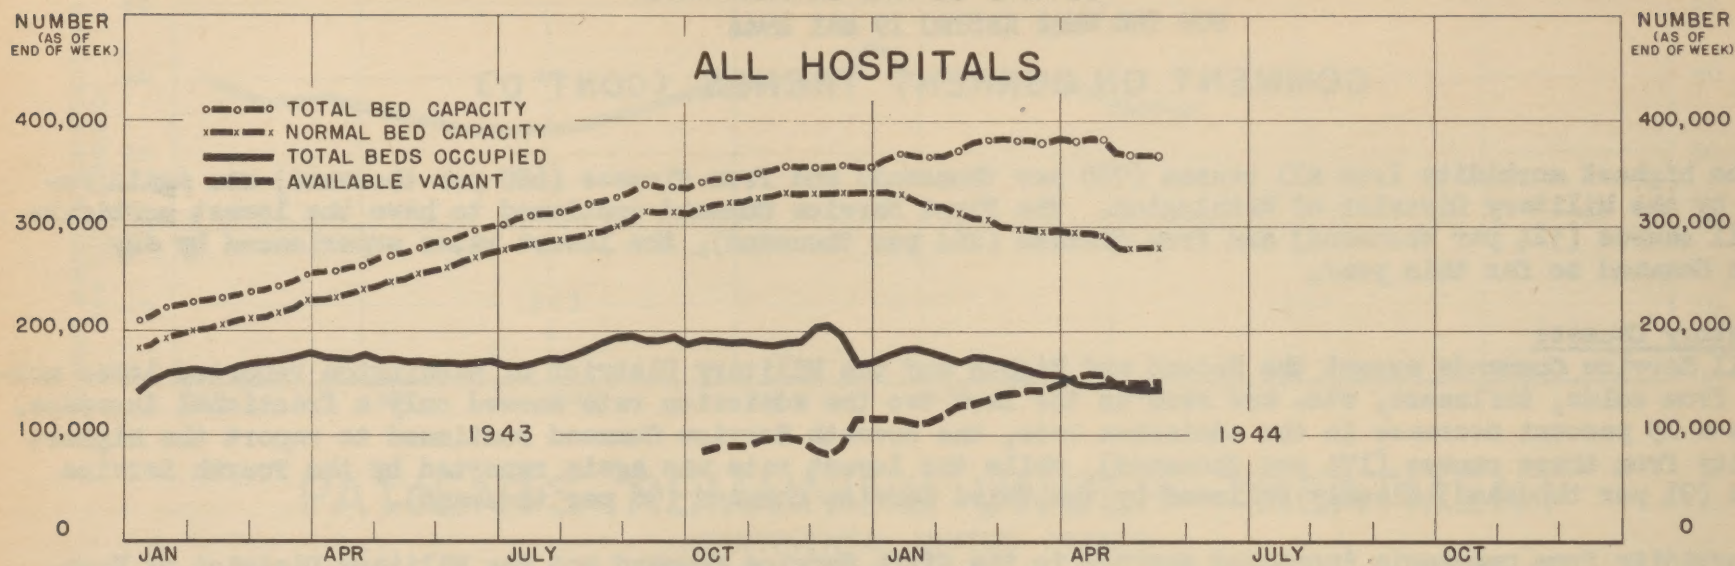

The sharp declines in the number of new cases of measles, mumps, and scarlet fever were general. The increase in the number of meningitis cases was chiefly the result of the corresponding increase in the Fourth Service Command.

NON-EFFECTIVE RATE:

The non-effective rate increased from 35.9 for the previous week to 36.5 for the current week. It should be emphasized that despite lower morbidity experience the current level of the non-effective rate is higher than during the corresponding period of 1943 almost entirely because of the steadily increasing number of evacuees from overseas theaters. Because of the non-uniformity in the distribution of General Hospitals as between Service Commands, variations in the non-effective rates by Service Command have little significance.

HOSPITALIZATION DATA*

CONTINENTAL UNITED STATES

*EXCLUSIVE OF BEDS REPORTED IN DISPENSARIES, CONVALESCENT FACILITIES, VENEREAL DISEASE FACILITIES, AND COLLEGE TRAINING UNITS.

†ALSO INCLUDES BEDS IN NON-FIXED HOSPITALS AT MANEUVER AREAS.

RESTRICTED

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 19 MAY 1944

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week continued at about 36 per thousand strength. Thus far in 1944 the number of neuropsychiatric cases remaining has fluctuated in the range from 15,300 to 17,000 and for the week ending 19 May 1944 was reported at 15,582 or slightly above the number for the previous week. The number of malaria cases under treatment has increased steadily in recent weeks from a low of 1,748 on 14 April to 2,048 on 19 May 1944; only 33 of these cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1,103 as of 19 May 1944.

The net number of battle casualty patients admitted during the week was 727, the highest number recorded so far this year. This increase was accounted for chiefly by gross admissions by transfer numbering 680 at the five receiving and evacuation hospitals (the net admissions at these hospitals were only 320 because 360 such patients were disposed of by transfer during the week).

CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 19 May 1944 was reported at about 367,000 or about 1,000 less than at the end of the previous week. The number of beds occupied increased to 143,500 or 1,000 more than at the end of the preceding week, while the number of "available vacant" beds decreased to 150,500. Total beds occupied represented 39 percent of total bed capacity. There were 10 stations with bed capacity of about 7,100 having no "available vacant" beds; one General Hospital with a bed capacity of about 3,000 was included among them.

The number of normal beds remained about the same as in the previous week at about 280,000 or 76 percent of the total bed capacity. Included in the normal bed capacity on 19 May 1944 were 648 T/O hospital beds and tents, while the total bed capacity included 728 such beds, of which 172 were occupied.

The total bed capacity of General Hospitals, which has shown a steady increase in recent months, was again reported at about 109,000 (the highest figure so far attained); about 47,000 of these beds (or 43 percent) were occupied. The "available vacant" beds at General Hospitals numbered 40,000 as of 19 May 1944. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of T/O hospital beds and tents mentioned above) continued at the 258,000 beds reported as of 5 and 12 May 1944. Normal beds in these hospitals remained at about 195,000. Total beds occupied as of 19 May 1944 numbered 97,000 (or 37 percent of the corresponding total bed capacity) which is the lowest level reported during 1943 and 1944 to date. Station Hospitals had 111,000 "available vacant" beds as of 19 May 1944.

As of 19 May 1944 the bed capacity of convalescent facilities in General Hospitals numbered 14,021 beds of which 4,268 beds (or 30 percent) were occupied.

RESTRICTED

VOLUME IV REPORT NO. 20
WEEK ENDING 19 May 1944

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 28 APRIL 1944
COMMENT ON RECENT DEVELOPMENTS

The data of this Supplementary Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 28 April 1944 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

Hereafter, the term "month" will be used to denote the four or five week period based on the number of Fridays in the calendar month.

This Supplementary Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal disease and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 35. Similar charts for specified diseases appear on pages 37, 39, and 41. A chart showing mortality trends is presented on page 43. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 44. The most pertinent morbidity data for individual stations are presented on pages 45 to 71. On pages 72 and 73 the six stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on page 2.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

During April, morbidity from all causes and from disease was again about 10 percent lower than during the previous month. Over the four month period since December 1943, morbidity from all causes has declined almost 40 percent. The annual admission rate from all causes for April was reported at 639 per year per thousand strength or more than 25 percent below that for April 1943 and the lowest level reached in 1942 and subsequent. Almost the entire decrease from March to April 1944 in the admission rate for disease was accounted for by lower morbidity from colds, influenza, etc.

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

The admission rate for injury decreased fractionally from the low level prevailing during the previous three months to reach a rate of 65 per thousand, the lowest ever recorded.

Lower morbidity during April as compared with March was reported in every Service Command. The largest decreases in the admission rates from disease occurred in the Third, Sixth, and Seventh Service Commands, all of which showed declines of more than 100 per thousand, principally because of corresponding decreases in morbidity from colds, influenza, etc. The Second Service Command reported the highest admission rates from all causes and from disease - about 25 percent higher than for the country as a whole. The lowest admission rates from all causes and from disease - about 11 percent below those for the United States as a whole - were again registered in the Eighth Service Command.

RESPIRATORY DISEASES:

Admission rates from colds, influenza, etc. declined about 25 percent from 213 per thousand in March to 159 per thousand in April. This latter rate was about 45 percent below that for April 1943 and 40 percent below the corresponding rate for April 1942. Morbidity from respiratory causes has followed much the same trend in 1944 as in 1943, but with admission rates about 140 per thousand lower.

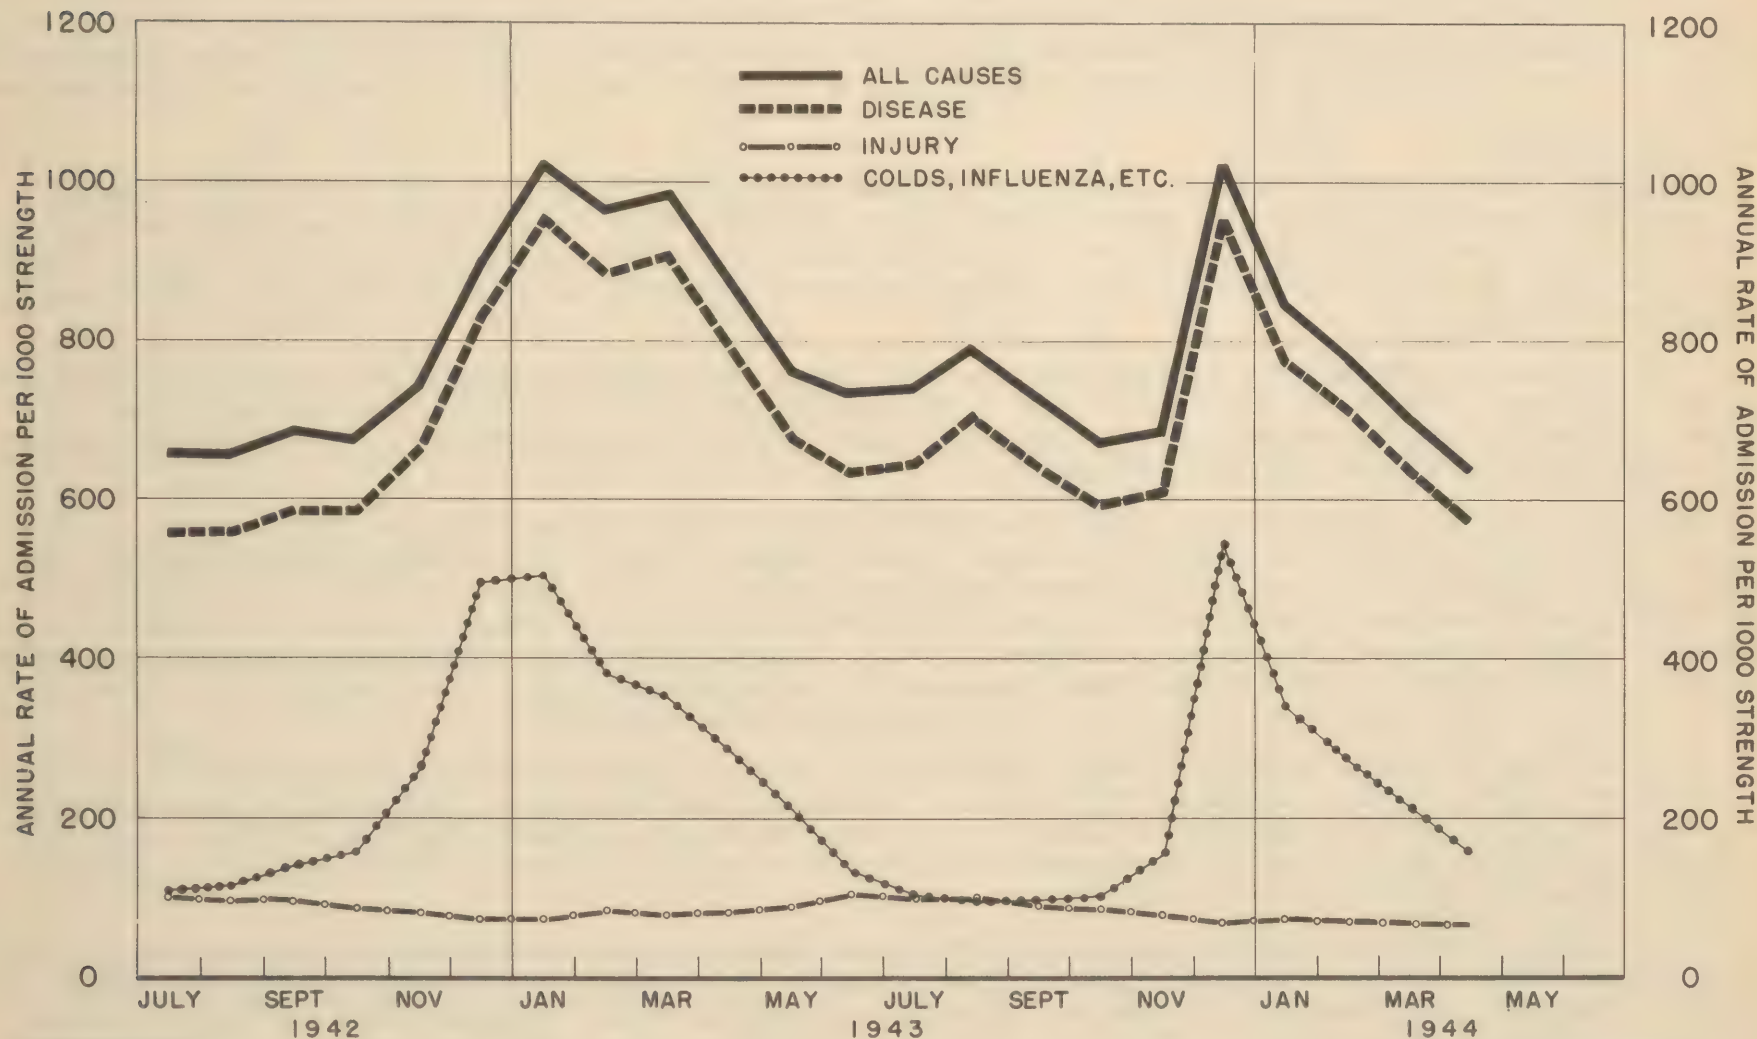

Lower morbidity from colds, influenza, etc. was registered in all Service Commands. The largest decreases in morbidity from this cause were recorded in the Second, Third, Sixth, and Seventh Service Commands, all of which showed declines of about 100 per thousand or more. Despite the large decreases in the latter two Service Commands, they continued to report the highest morbidity from respiratory causes (with rates approximating 250 per thousand or about 60 percent higher than for the country as a whole). The lowest rate of admission from colds, influenza, etc. was again reported by the Eighth Service Command (at 130 per thousand or almost 20 percent under the rate for the entire United States).

Morbidity from all types of pneumonia again declined about 20 percent. The annual admission rate of 13.5 per thousand for April was about 35 percent lower than for the corresponding month of 1943. The Sixth and Seventh Service Commands continued to report by far the highest morbidity from pneumonia, having admission rates about twice as high as those for the country as a whole, even though they experienced lower morbidity from this cause during April than during March. The lowest admission rate from pneumonia was reported by the Ninth Service Command, with the Fourth and Eighth Service Commands also having low rates.

Atypical pneumonia again accounted for about 57 percent of the total pneumonia admissions, a somewhat higher percentage than in previous months. The proportion of pneumonia cases diagnosed as atypical was highest in the First and Fourth Service Commands (about 70 percent).

MORBIDITY FROM — ALL CAUSES — DISEASE — INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery decreased by about 10 percent in April as compared with March to the lowest rate reported since March 1943. The rate for April 1944 was about 10 percent lower than that for April 1943. The Second and Fourth Service Commands reported the highest admission rates from this cause (somewhat in excess of 8 per thousand), while the lowest morbidity (2 per thousand) was again reported by the Sixth Service Command.

VENEREAL DISEASE:

Morbidity from venereal disease excluding EPTS cases increased slightly in April to 29.5 per thousand. This rate is relatively high as compared with the experience during 1943 and is about 20 percent above the rate for April 1943. The entire increase is due to gonorrhea since the current level for syphilis is about 10 percent under that in 1943, while for all other venereal diseases morbidity has recently been more than 30 percent lower than in 1943.

The Second and Fifth Service Commands continued to report the highest morbidity from venereal disease excluding EPTS cases, while the Military District of Washington again experienced very low morbidity from this cause. The Second Service Command shows a relatively high rate of admission because of high incidence among task force troops not under its jurisdiction.

Morbidity represented by venereal EPTS cases was reported at about 26 per thousand during April, an increase of almost 50 percent over the corresponding figure for March. This sharp change is more apparent than real since it reflects different administrative practices (changes in induction procedure) which resulted in relatively few inductions in March and as a result a correspondingly larger number in April. Variations in the admission rate for venereal EPTS cases as between Service Commands have little significance because they reflect a different geographical distribution of Army personnel as compared with that of new inductees, different proportions of white and colored selectees, and varying administrative practices.

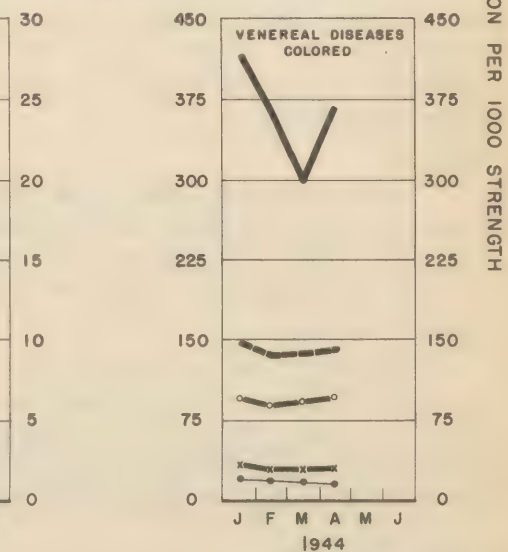

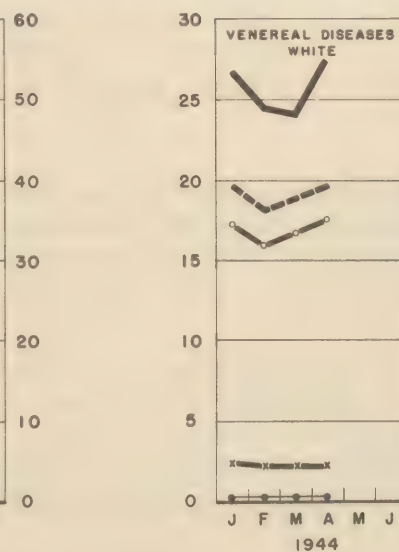

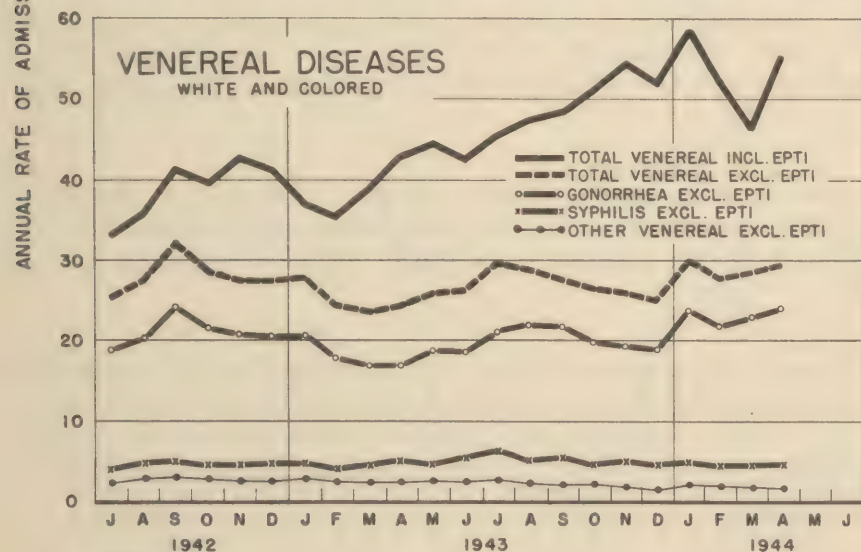

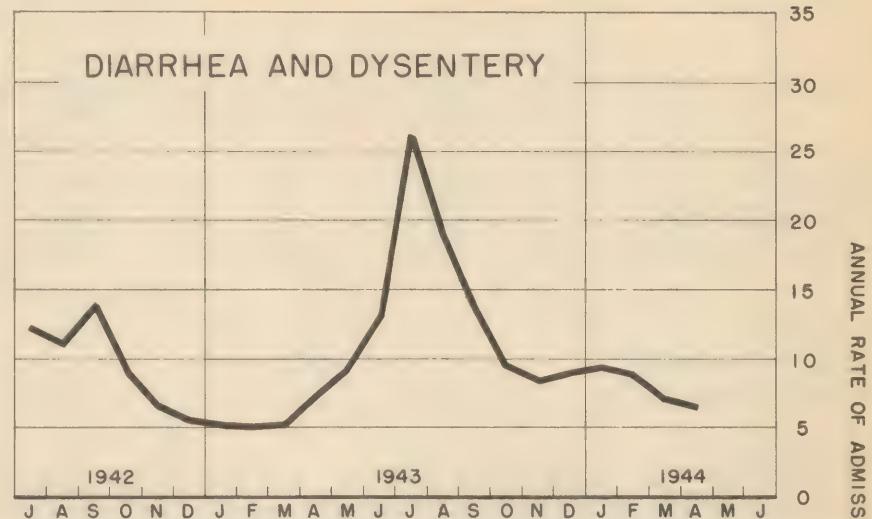

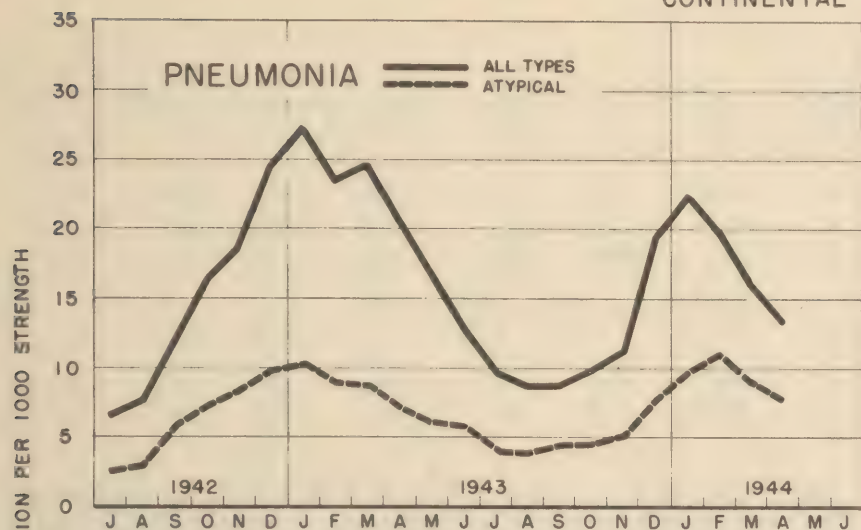

The markedly different venereal disease experience by color is indicated in the chart on page 37. Morbidity from venereal disease excluding EPTS cases is 7 times as high for colored troops as for the remainder of the Army, while for the EPTS cases the colored rate is about 30 times as great. The data for March 1944 and earlier are based on data in the Supplementary Health Report on page 33 of Weekly Health Report No. 19, while the April data are preliminary and subject to revision.

The numbers of venereal disease (excluding EPTS) cases remaining under treatment in hospital at the end of the month are shown by Service Command in the following table. The numbers are related to the total number of patients remaining under treatment in hospital as of the end of the month. From the table it appears that .9 percent of the total patients in hospital are syphilis cases, while 1.7 percent have other venereal diseases (including gonorrhea). The longer duration of hospitalization for syphilis is thus indicated by the fact that only about 15 percent of the venereal admissions are for this cause as contrasted with about 35 percent of the cases remaining under treatment.

MEASLES:

Morbidity from measles showed the expected seasonal trend decreasing from a peak in March to a somewhat lower rate for April, as in previous years. However, in 1944 the incidence of morbidity from this cause was much lower (about 60 percent) than for the previous two years. The admission rate for April 1944 was about 65 percent lower than that for April 1943. The highest morbidity was registered in the Sixth Service Command (11 per thousand) which nonetheless had a relatively low rate as compared with those prevailing during the peak month of previous years.

MUMPS:

Morbidity from mumps continued in April at the same level as in March (about 11 per thousand). Morbidity from this cause was nevertheless only about 50 percent of that prevailing during the corresponding months of 1942 and 1943. The Third and Seventh Service Commands again had the highest admission rates from this cause - about 50 percent above the rate for the country as a whole.

SCARLET FEVER:

Morbidity from scarlet fever decreased by about 20 percent as compared with the previous month. In April 1944 the admission rate from this cause was only about 50 percent as high as that for April 1943, although somewhat above the corresponding figure for April 1942. The Sixth and Seventh Service Commands again reported by far the highest morbidity from this cause, the former having a rate about three times as high as that for the United States as a whole, and the latter a rate more than two times as high.

MENINGITIS:

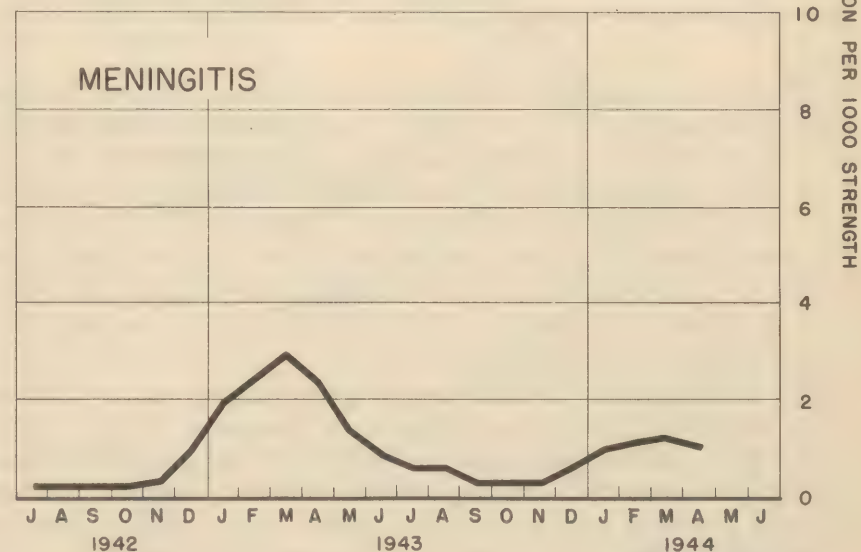

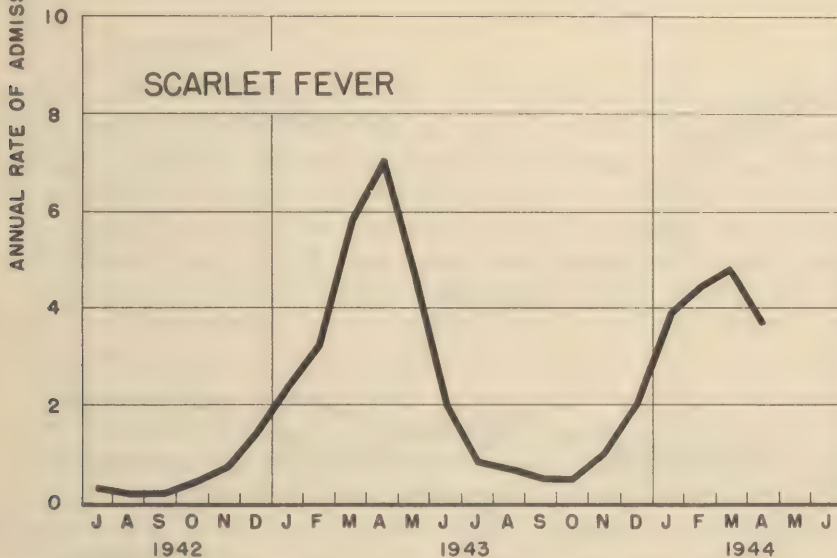

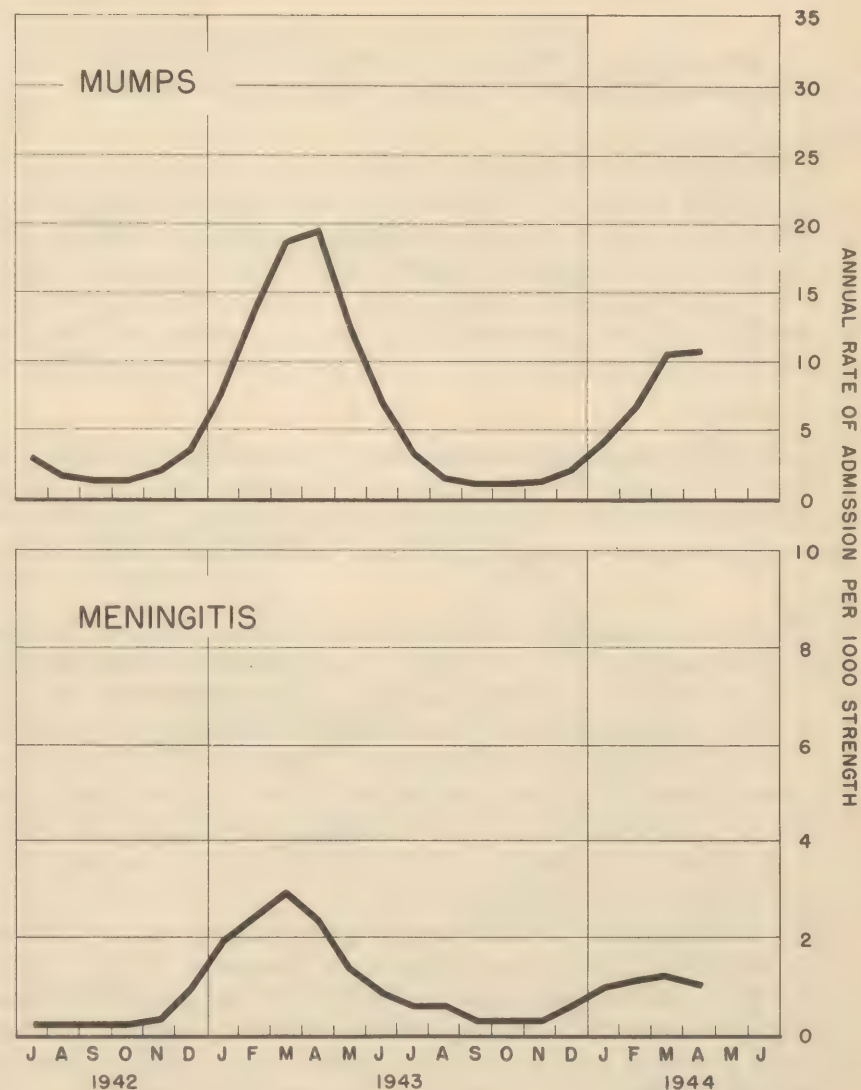

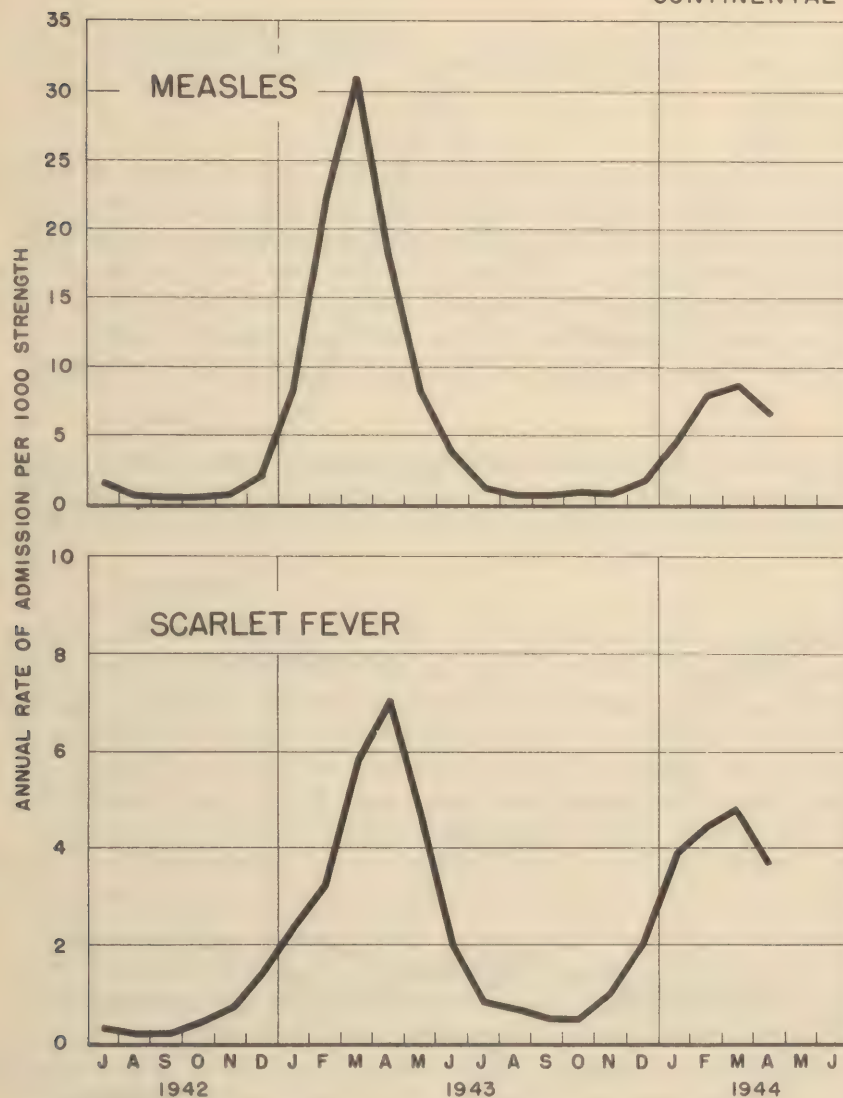

Morbidity from meningitis decreased slightly and for April was reported at 1.0 per thousand. This is only about 40 percent of the rate reported for this cause in April 1943 which was close to the highest rate during

MORBIDITY FROM —

MEASLES—MUMPS

SCARLET FEVER—MENINGITIS

CONTINENTAL UNITED STATES

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

the past two years. The Third Service Command again reported the highest incidence of meningitis with a rate about 75 percent higher for the country as a whole.

RHEUMATIC FEVER:

Morbidity from rheumatic fever was reported at 2.3 per thousand for April or slightly higher than in March. There has been a steady increase in the reported morbidity from this cause during 1944 from the relatively low level of about .8 per thousand which prevailed during the latter part of 1943. The admission rate for April 1944 was about 30 percent higher than that for April 1943, but nevertheless slightly below the peak rate of the past two years reached in May 1943. The Seventh Service Command continued to report the highest morbidity from this cause (9.0 per thousand or about the same as the previous month), and the Sixth Service Command again showed a relatively high rate (6.2 per thousand or almost three times as high as for the country as a whole).

TUBERCULOSIS:

Morbidity from this cause showed a slightly lower rate for April than for the previous month.. The admission rate for April at only .8 per thousand was the lowest recorded thus far. As of the end of the month there were about 1000 cases of tuberculosis remaining under treatment; these represented about .7 percent of the total number of patients remaining under treatment in hospital.

MALARIA:

Morbidity from malaria acquired in the United States continued at a rate of .1 per thousand for the sixth consecutive month. On the other hand, malaria presumably acquired outside of the United States accounted for an admission rate of 3.9 per thousand, the highest so far recorded. The continued sharp increases during 1943 and 1944 in the admission rate from malaria acquired overseas reflect the increasing number of troops returning to this country from malarious areas. Whereas the largest numbers of cases of malaria acquired in the United States have generally been reported from the Southern states, those acquired overseas are fairly uniformly distributed as between the Service Commands. As of the end of the month there were about 1850 cases of malaria remaining under treatment, representing about 1.2 percent of total patients remaining under treatment in hospital.

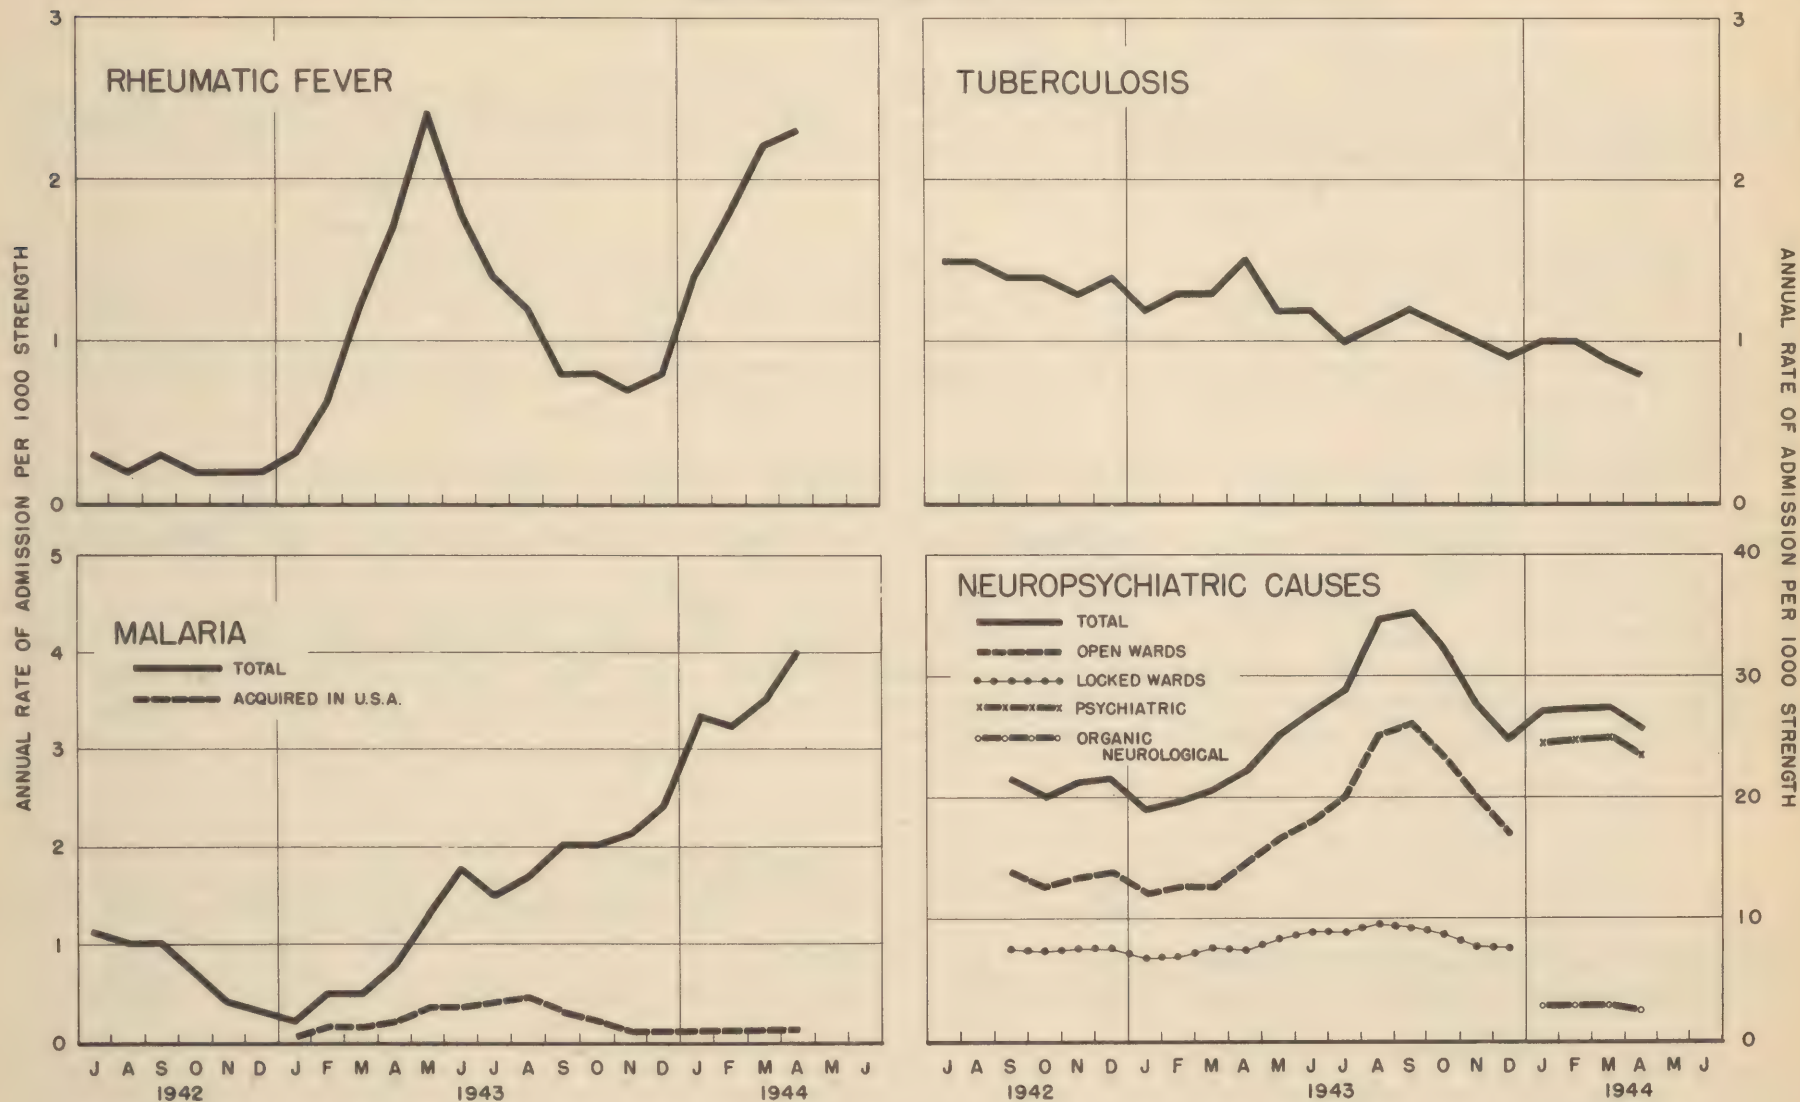

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission from these causes decreased to 25.5 per thousand, the lowest rate reported since May 1943 with the exception of December 1943. As in the previous month psychiatric cases accounted for about 90 percent of the total. Most of the Service Commands had admission rates for these causes closely approximating the rate for the entire United States. However, the First Service Command and the Military District of Washington had significantly lower rates, while the Second Service Command had a very high rate (about double that for the country as a whole) principally because of high admissions at Atlantic City AAF Redistribution Station and at General Hospitals.

The number of neuropsychiatric cases remaining under treatment at the end of the month decreased to 15,582

MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

or about 3 percent less than at the end of March and was at the lowest level so far this year. Both open and locked ward cases decreased as compared with the previous month. Neuropsychiatric cases remaining represented 10.3 percent of the total patients remaining in hospital for all causes, with the locked ward cases accounting for 3.1 percent and the open ward cases the remaining 7.2 percent.

MORTALITY:

The mortality rate from all causes was reported at 2.12 per year per thousand strength or about 15 percent lower than for March. The reported mortality rate from injury accounted for the major portion of the decrease and in April was at the lowest level registered since April 1943. Recent studies indicate that reporting of deaths on Forms 86ab is incomplete, especially in regard to deaths from injury. The understatement in injury deaths is possibly as much as 25 percent.

NON-EFFECTIVE RATE:

The non-effective rate for April 1944 was 36.2 per thousand strength or about 6 percent lower than for the previous month. For April the non-effective rate from injury was 7.2 per thousand strength or only slightly lower than the corresponding rates for the previous months of 1944. At least 10 percent of the current non-effective rate represents days lost by evacuees from overseas.

The variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the non-effective rates excluding General Hospitals, the variations in the non-effective rate by Service Command are seen to be very much smaller than when the days lost in the General Hospitals are included, as evidenced in the table below;

			Service Command									
			I	II	III	MDW	IV	V	VI	VII	VIII	IX
Including	General	Hospitals	34.1	45.7	39.4	68.3	31.0	52.0	43.6	38.1	30.8	38.5
